

Windmill

Automated Testing for Web Applications

Demo!

Requirements

- Quickly build regression tests
- Run single test on all target browsers
- Easily debug tests
- Easily fit in to continuous integration

Other Tools

- **Selenium, Sahi**
Main alternative, Java, Debugging, Integration
- **Watir**
Trusted space, different project for each browser
- **WebTest**
Watched demo, didn't appear to fulfill needs

Architecture

Mile High Overview

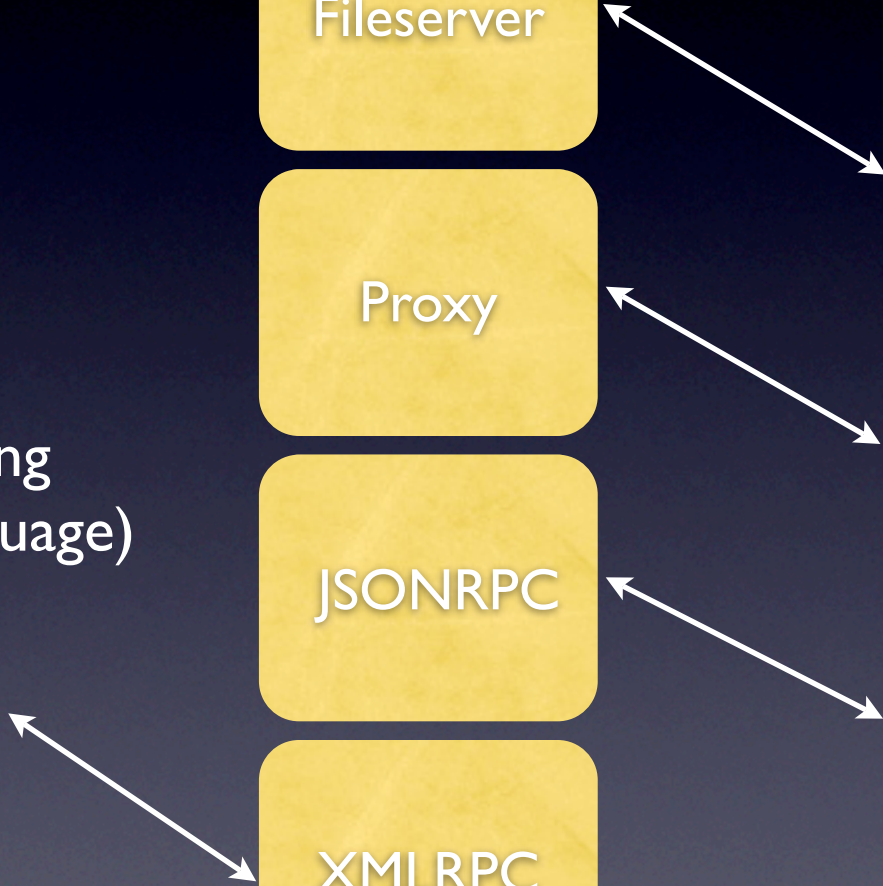

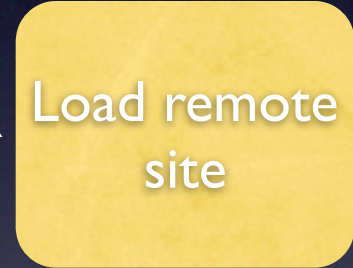

Test Authoring Library (any language)

Service (python)

IDE (javascript)

XMLRPC Workflow

Authoring
Lib

Service

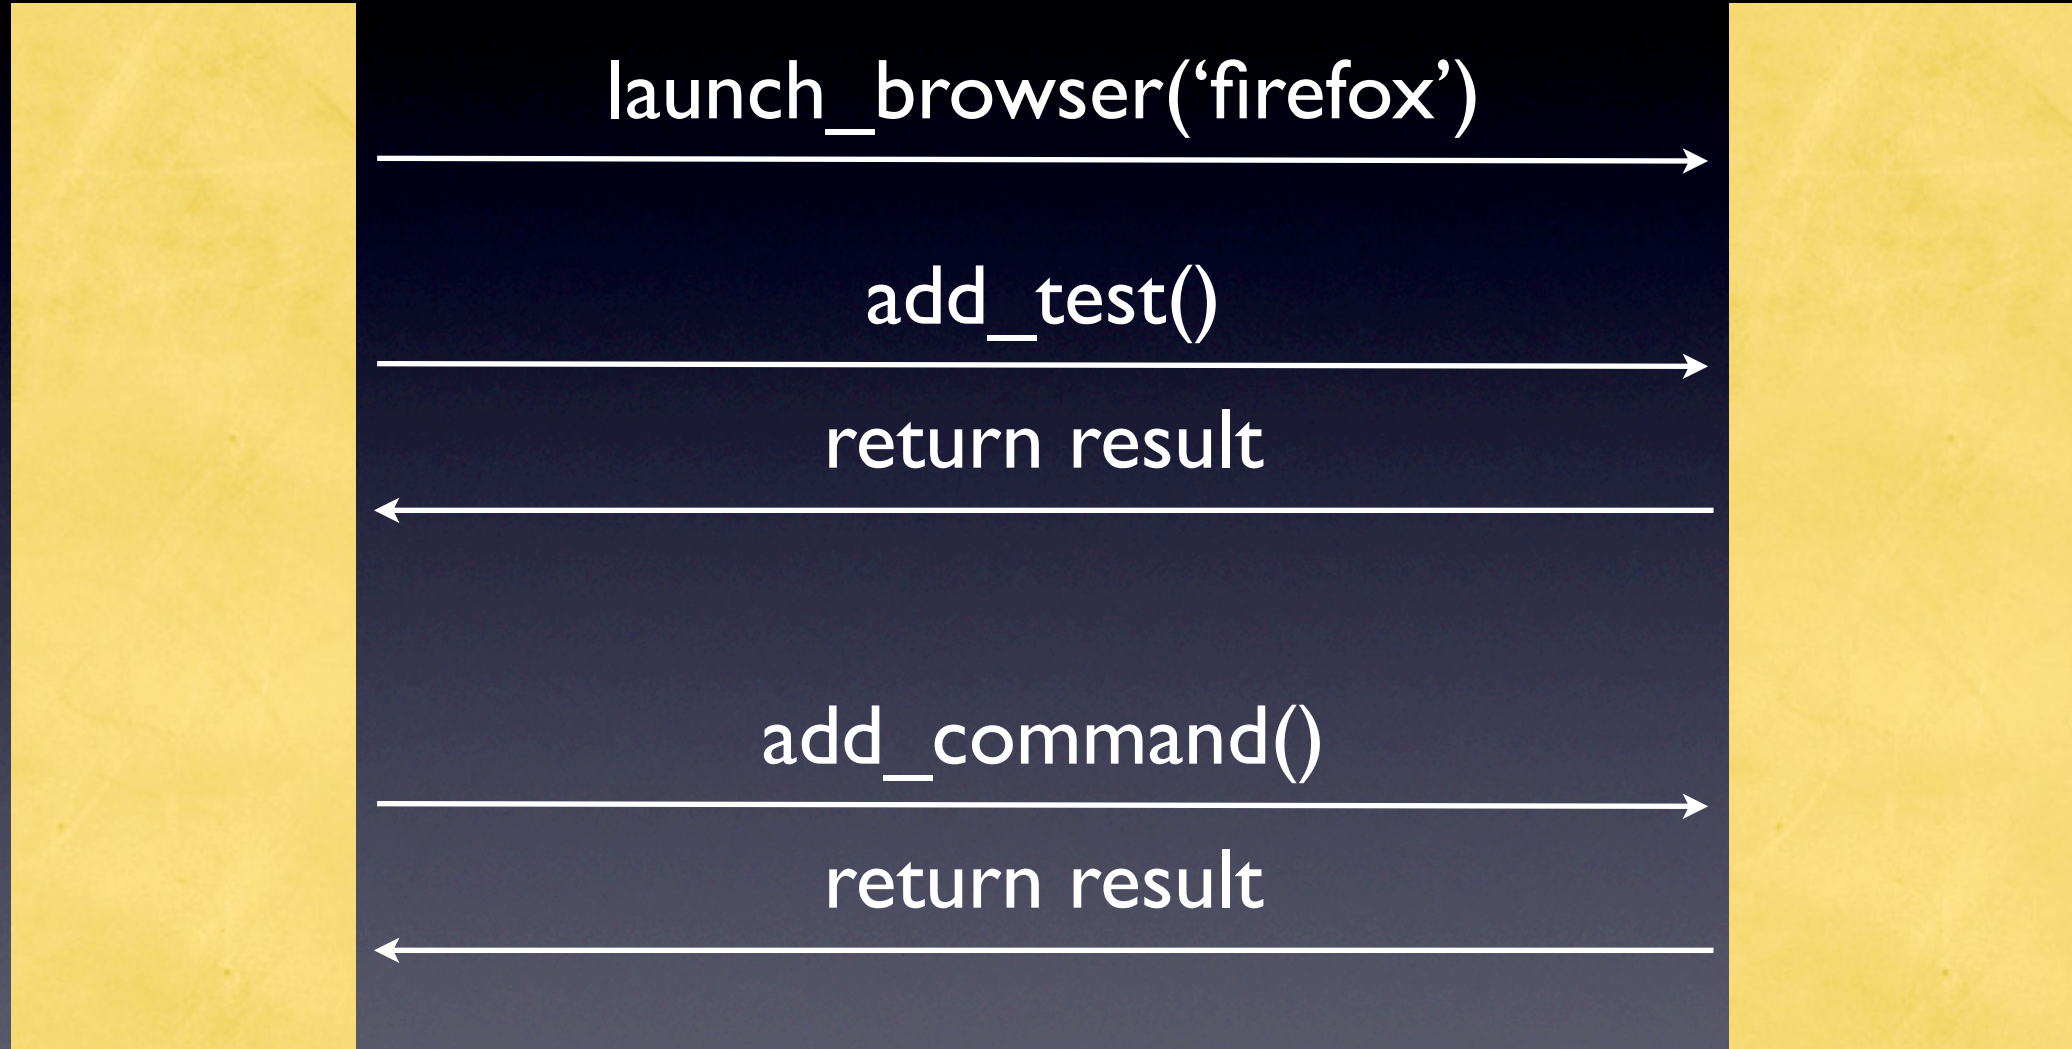

launch_browser('firefox')

add_test()

return result

add_command()

return result

JSONRPC Workflow

Service

IDE

next_action()

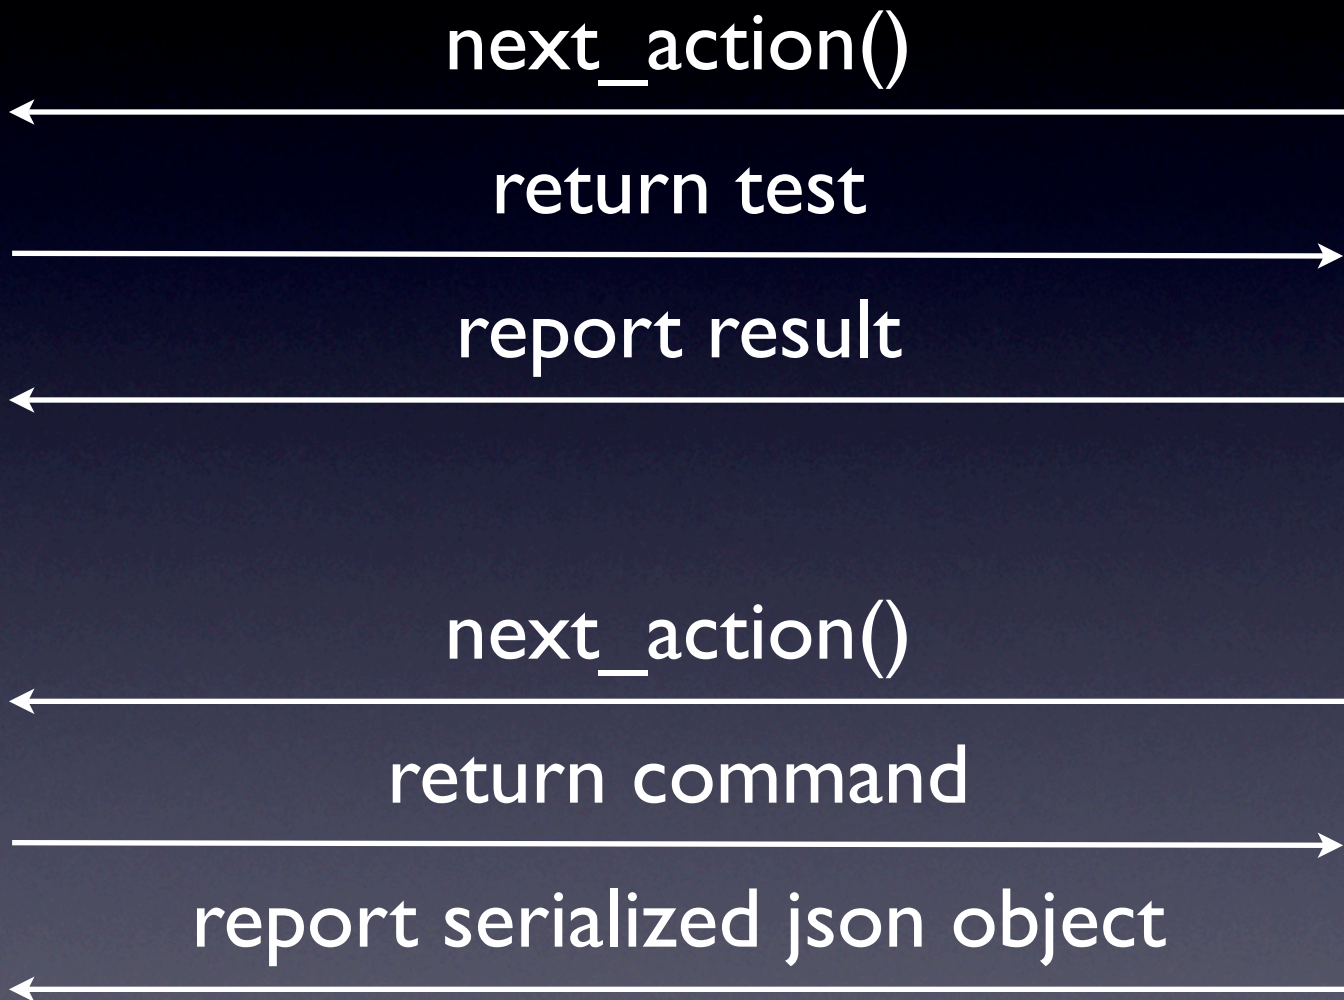

return test

report result

next_action()

return command

report serialized json object

Supporting continuous integration

Service

Browser Launching and configuration

Test Input

Results Tracking and output

Dynamic debugging information requests

Dynamic commands

IDE

Build UI and start running tests

Test running, performance, debugging

Stop on Failure and interactive debugging

Arbitrary remote javascript execution

Command execution

Now the fun stuff

What can I automate?

OOTB support for:

open, click(s), check, radio, wait, type, select, wait, assert,
mouse events, keyboard events

Advanced:

Drag and Drop, Window Management...

DOM Element Access:

id, link, name, jsid, classname, tagname, xpath

Extending the Controller API:

Extensions are simple to write in JavaScript

Extensions are first class citizens

Features

Windmill IDE

- Cross browser test recording
- Multiple layers of support for performance information and metrics
- DOM explorer, Assertion builder
- Javascript shell. (on the list to be enhanced)

Tests

- **Creation**
IDE: Recorder/Editor
Manual test writing
- **Formats**
Python, JavaScript, JSON
- **Dependencies**
Directory heirarchy
Setup/TearDown
Suite Modules

Customizable
Reporting

Details:

<http://windmill.osafoundation.org/trac/wiki/BookChapter-5-RunningTests>

Tests Cont.

- **Python**
Server side logic
One action at a time
Best for linear linear tests
- **JavaScript**
Flexible, dynamic, more control
Pure JavaScript, helper functionality
Access to JUM functions
Answer to conditionals and loops

```
import functest
from windmill.authoring import WindmillTestClient
from windmill.authoring import setup_module, teardown_module
```

```
def test_login():
    client = WindmillTestClient(__name__)
    client.type(text=functest.registry['username'], id='u'email')
    client.type(text=functest.registry['password'], id='u'pass')
    client.click(id='u'doquicklogin')
    client.waits.forPageLoad(timeout='u'40000')
```

```
windmill.jsTest.require('shared/test_login.js');

var test_bazThing = function () {
    var nodeld = getSomeDOMNodeDynamically();
    windmill.jsTest.actions.click({ id: nodeld });
    jum.assertEquals(nodeld, 'test');
}
```

Service Features

- Extensible logging system (stdlib logging module)
- 3 run modes.
 - “headless” command line. stdout.
 - “shell” mode. ipython or stdlib python shell.
 - wx GUI. PyCrust shell (currently broken, Jacob)
- Browser launching and configuration.
- Server level pre and post hooks for test results parsing, validation, etc.

Status

Flash

- Currently not implemented in Windmill
- Adding support would involve:
 - Building a layer between JS and Flash (ExternalInterface hooks)
 - Addition of Windmill JS controller methods
- I don't know flash/flex
- Feel free to build this layer :)

http://kb.adobe.com/selfservice/viewContent.do?externalId=tn_15683

Use Cases

- **Developer Sanity Check**
Using the test hierarchy developers could run selected, tests/suites, or the entire test repo against the app they are working on to avoid regressions.
- **Continuous Integration**
Using build bot, tbox, or a simplified home brew, dedicated machines constantly run test suites against stage app instances. Failures reported to a list, email, etc.
- **Push QA Cycle**
While QA is doing manual validation of new features, specific test runs can be fired off on dedicated boxes, or VM's on QA engineer machines. QA sign off requires manual feature validation and automated regression test success.

Demo!

Development

- Proxy domain forwarding improvement
Social Networks, iFrames
- Simplify install/service stability (Linux, Win)
- XPath implementation in IE
- Documentation, (Slide Quickstart Guide)
- 0.5 Release for Slide Adoption (use src until then)
- Moving the project to GetWindmill.com

Getting Started

- **Get Windmill From Source**

<http://windmill.osafoundation.org/trac/wiki/BookChapter-1-Install>

- **Record/Write Some Tests**

[http://windmill.osafoundation.org/trac/wiki/BookChapter-3-](http://windmill.osafoundation.org/trac/wiki/BookChapter-3-UsingWindmillIDE#RecordingTests)

[UsingWindmillIDE#RecordingTests](http://windmill.osafoundation.org/trac/wiki/BookChapter-3-UsingWindmillIDE#RecordingTests)

<http://windmill.osafoundation.org/trac/wiki/BookChapter-4-WritingTests>

- **Play Your Tests**

<http://windmill.osafoundation.org/trac/wiki/BookChapter-5-RunningTests>

- **Log Those Bugs**

<http://windmill.osafoundation.org/trac/newticket>

- **Thanks for your patience.**

Q & A
